

Where shredder performance really begins

Attar Metals shifted the work upstream — and the results were measurable from day one!

If your shredder is absorbing more stress than it should, the fix may not be inside the machine.

Attar Metals Inc., a full-service recycler in Mississauga, Ontario, was facing exactly that problem:

excessive wear, too many unplanned stops, and a growing safety concern,

driven by unknown materials entering the line at full speed.

Their solution?

Moving the work upstream — before material ever reaches the hammermill.

After installing a Zato Blue Devil low-speed pre-shredder in April 2023, the results came quickly: *approximately 30% reduction in shredder maintenance costs, fewer reactive repairs, improved safety, and a more consistent, higher-throughput feed into the primary shredder.*

Tony D'Alonzo, who has spent four decades managing heavy equipment in scrap operations, shares the full story.
